CARGO LIFT / MAZANINE LIFT GOODS LIFT

A cargo lift, also known as a goods lift or freight elevator, is a specialized elevator designed to transport heavy goods and materials rather than passengers. It's commonly used in warehouses, factories, construction sites, and other industrial settings where the efficient movement of large or bulky items between different floors is necessary. Cargo lifts typically have higher weight capacities and larger dimensions compared to regular passenger elevators, and they are built to withstand the rigors of frequent and heavy-duty use.

Types of Cargo Lift

SMW HYDRAULICS INDIA

ECONOMY LIFT

Economy goods lifts are typically designed to be cost-effective solutions for transporting goods between different floors in commercial or industrial buildings. Here are some common features of economy goods lifts:

MAX. CABIN SIZE

► **Cost-Effective**

► **Simple Construction**

► **Basic Controls**

► **Safety Features**
